

Language Learning App - Functional Prototype

Korean City | Beta 0.6

PROJECT SUMMARY

A scenario-based mobile learning experience that helps English-speaking travelers recognize and use practical Korean inside realistic interactions. Nine playable missions connect task-based dialogue with a separate Study Hub for independent vocabulary practice.

PROJECT AT A GLANCE

AUDIENCE English-speaking travelers who need situation-specific Korean.

SCOPE Nine fully playable missions plus a Study Hub for language practice.

LEARNING DESIGN Authentic tasks, cumulative choices, layered scaffolds, corrective feedback, scoring, and replay.

MY ROLE Concept, learning objectives, Korean and English content, interface direction, testing, debugging, and AI-directed development.

The learner problem

Travelers need language they can recognize and use inside a real interaction, not only vocabulary they can recall in isolation.

DESIGN CHALLENGE Build beginner-friendly practice that prepares an English-speaking traveler to understand Korean, choose a natural response, and complete a practical task.

Design response

AUTHENTIC CONTEXT Every mission begins with a recognizable need: take a taxi, order food, shop, check into a hotel, navigate a hospital, or use the subway.

USEFUL PERFORMANCE Learners interpret what a character says and respond with a phrase that would sound natural in that moment.

CONTROLLED CHALLENGE Three-answer questions remain objectively gradable while randomized choices and changing mission details support replay.

LAYERED SUPPORT Audio, slow audio, romanization, translations, vocabulary, and word-level glosses can reduce difficulty without replacing the task.

Current functional scope

Taxi Ride • Hotel • Mall • Market • Grocery Store • Coffee Shop • Restaurant • Hospital •
Subway

A shared lesson engine gives the nine missions a consistent interaction pattern while each mission changes the location, characters, task logic, visuals, vocabulary, and progress behavior.

A reusable scenario-based learning experience

The prototype converts each everyday situation into a short performance sequence with a clear beginning, task, complication, and closing.

ENTER THE SITUATION → LISTEN & INTERPRET → RESPOND → COMPLETE THE TASK → REVIEW RESULTS

Taxi Mission: the learner hears a driver's question, selects a personally relevant destination, and continues through an eight-question ride.

CONSISTENT ENGINE Mission selection, dialogue, audio, answer grading, vocabulary access, progress, retries, completion, and saved stars behave consistently across scenarios.

VARIABLE CONTENT The situation, character, visuals, available choices, dialogue, difficulty details, and closing interaction change by mission.

03 / KOREAN CITY BETA 0.6

Personalization supports authentic communication

Learner choices are not decorative. They establish information the learner must use correctly in later Korean exchanges.

Grocery Store: changing shopping list and item-specific response | Coffee Shop: order choices update as the conversation continues

REMEMBER PRIOR CHOICES A selected destination, product, drink, size, symptom, or service request can determine the later correct response.

USE NATURAL PHRASES The content favors complete, situation-appropriate Korean such as a request or confirmation instead of treating isolated nouns as sufficient answers.

REPLAY WITH VARIATION Randomized answer placement and changing details let learners repeat a familiar structure without receiving an identical interaction.

DESIGN PRINCIPLE: PERSONALIZATION SHOULD CHANGE WHAT THE LEARNER MUST UNDERSTAND OR SAY.

Scaffolding without removing the task

The learner can request targeted help while the Korean prompt, situation, and response decision remain visible.

Mall Mission: word-cluster glosses reveal only the requested English support; the incorrect response remains visible for corrective retry.

LISTENING SUPPORT Normal-speed and slow Korean audio are available for prompts and answer options.

READING SUPPORT Optional romanization, full translation, vocabulary access, and clickable word-cluster meanings allow graduated assistance.

CORRECTIVE FEEDBACK An incorrect choice is clearly marked, but the learner can continue trying until the task is completed.

ASSESSMENT LOGIC First-attempt correctness determines the mission's 0–3 star result; replay retains the learner's highest result rather than adding unlimited stars.

05 / KOREAN CITY BETA 0.6

The Study Hub extends learning beyond missions

Scenario performance and independent study are connected but distinct: missions create a reason to communicate, while the Study Hub supports deliberate language practice.

Study Hub navigation | Restaurant vocabulary card with answer reveal and self-rated difficulty

LEARN Browse mission vocabulary, reveal meanings, rate difficulty, and mark words already known.

PRACTICE Mix reading, visual, audio, and writing cards drawn from several vocabulary sources.

REVIEW Automatic tracking can surface frequently missed or revealed vocabulary for later study.

PERSONALIZE Known Vocabulary and My Stacks let learners remove mastered items and assemble personal study collections.

MISSION PRACTICE BUILDS CONTEXT. STUDY TOOLS BUILD RETENTION AND LEARNER CONTROL.

06 / KOREAN CITY BETA 0.6

Testing, iteration, and design ownership

Informal usability testing identified a gap between the designer's intended task and the learner's understanding of what to do.

1 OBSERVE In the Market Mission, a tester completed the interaction independently but did not recognize that the seller's comment was intended to invite haggling.

2 INTERPRET The difficulty was not the Korean response alone. The communicative goal was hidden, so the learner did not know that negotiating the price was the task.

3 REVISE Add the direct English instruction: "Haggle the price with the seller."

4 GENERALIZE When a future mission depends on an implied social intention, explicitly announce that intention before evaluating the learner's response.

My role

I conceived the app and learner problem; designed the objectives, scenario flows, Korean and English content, scaffolds, feedback, scoring, and interface; directed AI prompts and revisions; and tested and debugged each build.

AI generated the code and suggested possible improvements after I supplied detailed instructional and UI requirements. I evaluated those suggestions and determined what entered the design.

DEFINE THE LEARNING NEED → DESIGN THE EXPERIENCE → DIRECT THE BUILD → TEST → REVISE

Current status and next steps

Korean City Beta 0.6 is a functional prototype with nine fully playable missions and a Study Hub. The next phase is structured learner testing, continued Korean-language review, accessibility testing, and refinement of advanced listening and speaking practice.

What this project demonstrates

LEARNING EXPERIENCE DESIGN Authentic tasks, scaffolded support, personalization, feedback, assessment, and independent practice are aligned within one learner journey.

SYSTEM THINKING A consistent reusable engine supports nine distinct scenarios while lesson-specific variables create meaningful differences in content and interaction.

ITERATIVE PROTOTYPING Detailed requirements were translated into AI-generated builds, then inspected, tested, debugged, and revised against the instructional intent.

Prototype evidence shown here reflects design and informal usability testing; no formal learning-outcome study has been conducted.
